CHAPTER 1

Welcome and what to send us

Thank you for choosing Investo. We host your platform for you: the website, the customer dashboard, the admin panel, the database, security updates and backups. You do not need to install anything.

This guide takes you from purchase to your first real customer. Follow the chapters in order. The **Setup Checklist** in your admin panel follows the same steps and ticks each one off as you finish it.

Chapter	What you do	Time
1	Send us your details	10 minutes
2	Connect your domain	15 minutes, then up to 24 hours to work
3	Sign in for the first time	5 minutes
4	Set up PayRam to take crypto payments	1 to 2 hours
5	Set up email	20 minutes
6	Make the platform yours	1 hour
7	Write your legal pages	Depends on your lawyer
8	Final checks and launch	30 minutes
9	Who handles what	Read once

What to send us

Reply to your welcome email with:

Item	Example	Why we need it
Your domain	yourbusiness.com	Your site runs on it. You keep ownership of the domain.
Site name	Northwind Invest	Shown in page titles, emails and the dashboards.
Owner email	you@yourbusiness.com	We send your admin invite here. Use an address only you can open.
Support email	support@yourbusiness.com	Shown to customers. It can be the same as the owner email.
Logo files	PNG or SVG, one for light and one for dark backgrounds	Optional now. You can upload them yourself later.
Country and time zone	United Kingdom, UTC	Used for dates and your business details.

KEEP THESE TO YOURSELF

Never send us passwords, API keys, wallet seed phrases or recovery words. We never ask for them. You enter keys yourself in the admin panel, where they are stored safely on the server.

Connect your domain

Once your site is set up, we email you two or three **DNS records**. A DNS record tells the internet where your domain should point. You add them at the company where you bought your domain, called your **registrar**.

The records

Use the exact values from our email. They usually look like this:

Type	Name (or Host)	Value (or Points to)	What it does
A	@	An address such as 76.76.21.21	Points yourbusiness.com to your site.
CNAME	www	A name such as cname.vercel-dns.com	Points www.yourbusiness.com to your site.
TXT	A name we give you	A code we give you	Proves you own the domain. Only sent if needed.

GOOD TO KNOW

"@" means the domain itself, with nothing in front. Some registrars ask you to leave the Name box empty instead of typing @.

Adding records at common registrars

Namecheap

- 1 Sign in and open **Domain List**.
- 2 Click **Manage** next to your domain, then the **Advanced DNS** tab.
- 3 Delete any existing A record for @ and any CNAME for www, so they do not clash.
- 4 Click **Add New Record** for each record in our email, fill in Type, Host and Value, and click the tick to save.

GoDaddy

- 1 Sign in and open **My Products**.
- 2 Next to your domain, click **DNS**.
- 3 Edit the existing A record for @ and the CNAME for www so they match our email. Remove any "Parked" A record.
- 4 Click **Add New Record** for any record that does not exist yet, then **Save**.

Cloudflare

- 1 Sign in, choose your domain, and open **DNS**, then **Records**.
- 2 Click **Add record** for each record in our email.

- 3 Set **Proxy status** to **DNS only** (a grey cloud), not Proxied. Otherwise the secure padlock cannot be set up.
- 4 Click **Save**.

Any other registrar

Look for a menu called DNS, DNS Management, Zone Editor or Advanced DNS. Add the records with the same Type, Name and Value. If you are stuck, send your registrar's support team our email with the records. They do this every day.

How long it takes

- Changes usually work within an hour, but can take up to 24 hours.
- The secure padlock (https) is set up automatically once the domain points to your site. You do not need to buy a certificate.
- We check every few minutes and email you when your domain is live.
- Then open **yourbusiness.com/admin**. The first step of the Setup Checklist turns green when you use the admin panel on your own domain.

CHAPTER 3

Sign in for the first time

- 1 Open the invite email we sent to your owner email and click the link. It works for 48 hours. If it runs out, ask us for a new one.
- 2 Choose a strong password you do not use anywhere else.
- 3 Set up two-factor sign-in. Install an authenticator app on your phone, such as Google Authenticator, Microsoft Authenticator or Authy. Scan the QR code on the screen and type the 6 digit code the app shows.
- 4 From now on, signing in needs your password and a fresh code from the app.

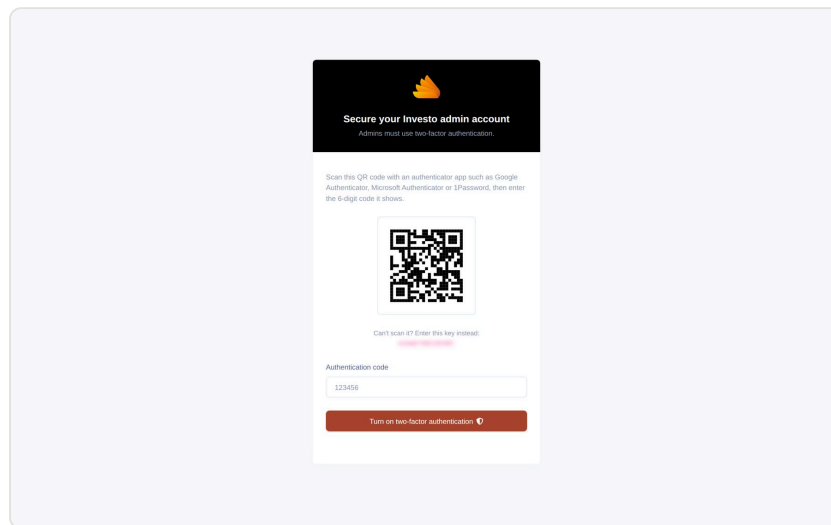

Figure 1. Setting up two-factor sign-in.

IMPORTANT

Two-factor sign-in protects your customers' money if your password is ever stolen. It cannot be skipped. Keep your phone safe, and tell us at once if you lose it.

Your Setup Checklist

After signing in, open **System**, then **Setup Checklist**. It lists every step in this guide. Green steps are done. Each step has a button to the page where you do it, and names the chapter of this guide that explains it.

Setup checklist

5 of 13 steps are done. Each step links to the page where you do it and to its chapter in the Launch Guide.

Check again

Your site

Connect your domain

To do

Customers trust a site on your own domain. We host it; you only point your domain at it. Add the DNS records we sent you at the company where you bought your domain. It can take up to 24 hours to work. Then open the admin panel on your own domain and this step turns green.

Launch Guide, Chapter 2

Your brand

Set your site name

To do

The site name appears in page titles, emails, the dashboards and the footer. Open Branding, type your site name in "Site name" and click Save changes.

Open Branding

Launch Guide, Chapter 6

Upload your logo and favicon

To do

Customers see your logo on every page, and the favicon in their browser tab. Open Branding and upload a logo, a logo for light backgrounds and a logo for dark backgrounds and a favicon. Then click Save changes.

Open Branding

Launch Guide, Chapter 6

Add your business details

Done

Your legal name and support email appear in emails and on the website.

Launch Guide, Chapter 6

Email and payments

Connect email

To do

Sign-up confirmations, password resets and statements are sent from your own address. Create a Resend account, add your domain there and add the DNS records it shows you. Then open Integrations and fill in the Email (Resend) card.

Open Integrations

Launch Guide, Chapter 5

Connect payments

Done

Customers cannot deposit, and withdrawals cannot be paid out automatically, until PayRam is connected.

Launch Guide, Chapter 4

Your content

Review your investment plans

To do

Your site starts with four sample plans. Check the names, rates, limits and minimum withdrawals before customers invest. Open Investment Plans, edit each plan as you need, then come back and click "Mark as done".

Open Investment Plans

Mark as done

Launch Guide, Chapter 6

Make the website yours

To do

The website starts with sample wording and pictures. Open Landing Page and change the headings, text and pictures to suit your business, then click Save changes.

Open Landing Page

Launch Guide, Chapter 6

Write your legal pages

To do

Terms, Privacy Policy, Risk Disclosure and Refund Policy must describe your business and your country's rules. The sample text is only a starting point. Open Landing Page, then each page under "Legal pages". Update the text and save. 4 of 4 pages still use the sample text.

Open Legal pages

Launch Guide, Chapter 7

Decide on the activity pop-ups

To do

The demo ticker shows example activity to visitors. Decide whether you want it, and check its lines. Open Social Proof, review the Demo ticker lines and turn it on or off. Then come back and click "Mark as done".

Open Social Proof

Mark as done

Launch Guide, Chapter 6

Before you launch

Turn off social proof test notifications

Done

Test notifications show sample activity to signed-in customers. Leave them off when real customers use the site.

Launch Guide, Chapter 8

Make a small test deposit and withdrawal

Done

The only way to be sure payments work end to end. Use a small amount such as \$10.

Launch Guide, Chapter 8

Maintenance mode is off

Done

While it is on, customers may be locked out and deposits or withdrawals may be paused.

Take crypto payments with PayRam

PayRam is the payment system your customers pay through. It is **self-hosted**: it runs on your own server, and the money goes straight to wallets that only you control. No company holds your funds, and there are no chargebacks.

WANT US TO DO IT?

This is the most technical chapter. If you prefer, we can do the whole PayRam setup for you as a paid service. Just ask.

What you need

- A small cloud server: 2 CPU cores, 4 GB of memory and 50 GB of disk, running Ubuntu 22.04 or newer. Any provider works, for example DigitalOcean, AWS or Hetzner. PayRam also offers a ready-made DigitalOcean server.
- A subdomain for PayRam, for example **pay.yourbusiness.com**, pointing to that server with an A record (see Chapter 2).
- Your own crypto wallets for receiving payments, for example a USDT wallet on Tron (TRC20). Keep the seed phrase offline and never share it.

Step 1: Install PayRam on mainnet

- 1 Connect to your server with SSH.
- 2 Make sure ports 80 and 443 are open in your server's firewall.
- 3 Run PayRam's installer with the mainnet option: **sudo bash -c 'bash <(curl -fsSL https://payram.com/setup_payram.sh) --mainnet'**
- 4 When it asks about SSL, choose **Let's Encrypt** and enter your PayRam subdomain, for example **pay.yourbusiness.com**.
- 5 When it finishes, open **https://pay.yourbusiness.com** and create your PayRam account.

IMPORTANT

Mainnet means real money. PayRam also has a testnet mode for practice. Do not use testnet for your real site.

Step 2: Set up PayRam

In the PayRam dashboard:

- 1 Open **Settings** and set the **Site URL** to your PayRam address, for example **https://pay.yourbusiness.com**. Payments fail if this is missing.
- 2 Add your **deposit wallets**: the addresses where customer payments should arrive. Start with USDT on Tron (TRC20), which has the lowest fees.
- 3 Create a **project** for your platform and **link the deposit wallet** to it.

- 4 Set up the **payout wallet** (hot wallet) that sends withdrawals to your customers. Keep a working balance of USDT in it, plus some TRX to pay Tron network fees.
- 5 Open **Settings, Projects**, your project, **API Keys**, and create a key. Copy it.

Step 3: Connect PayRam to your platform

Crypto payments (PayRam) Connected

Customers pay on your PayRam checkout page and choose the coin there. Deposits are confirmed and credited automatically.

PayRam server address

The address you open the PayRam dashboard with, without /login.

Project API key

In PayRam: Settings, Projects, your project, API Keys. It is stored on the server and never shown again.

Save **Check connection** **Disconnect**

One-time step so payments confirm automatically

1. In PayRam, open Settings, then Projects, then your project, then the Webhook tab, and click +.
2. Paste this URL:
3. Save it. PayRam now tells this site when each payment arrives.

Figure 3. The PayRam card in Integrations.

- 1 In your admin panel, open **System**, then **Integrations**.
- 2 In the **Crypto payments (PayRam)** card, type your PayRam address in **PayRam server address**, without /login at the end.
- 3 Paste the API key into **Project API key** and click **Save**. The key is stored on the server and never shown again.
- 4 Click **Check connection**. A green message means it works.
- 5 Copy the webhook address shown under **One-time step so payments confirm automatically**. In PayRam, open Settings, Projects, your project, the **Webhook** tab, click +, paste it and save. Now deposits confirm by themselves.

What your customers see

Customers type an amount and click Continue. A PayRam payment page opens with the coin, network, address and QR code. When they pay, the deposit is credited automatically.

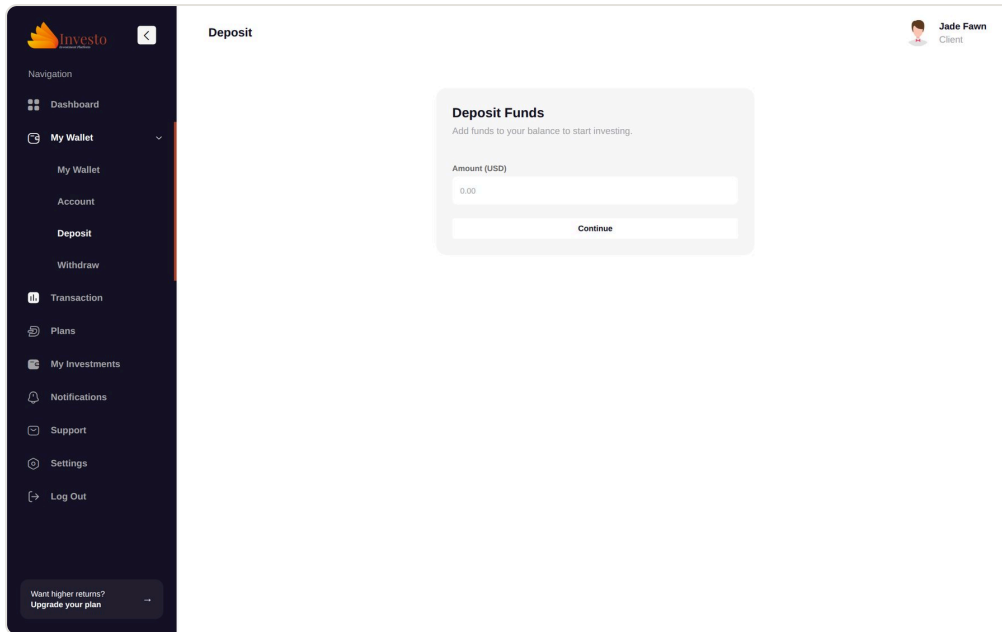

Figure 4. The customer deposit page with PayRam connected.

Without PayRam

Until PayRam is ready, you can take deposits by hand. In the **Wallet addresses for manual deposits** card, choose **Live** and enter your wallet address for each coin. Customers then see your address, and you confirm each deposit yourself under Deposits after checking it arrived.

Wallet addresses for manual deposits

Customers are shown these addresses when they deposit.

Check payments on the blockchain and confirm them under Deposits. When PayRam is connected, customers pay through PayRam instead.

Demo

BTC · Bitcoin	Receiving address
ETH · ERC20	Receiving address
USDT · ERC20	
USDT · TRC20	

Changes save when you click out of a box.

Figure 5. Wallet addresses for manual deposits.

Set up email

Your platform sends emails for sign-up confirmations, password resets, notifications and statements. They go through **Resend**, an email service with a free plan, from your own address such as no-reply@yourbusiness.com.

Step 1: Create a Resend account and add your domain

- 1 Create a free account at resend.com.
- 2 Open **Domains** and click **Add Domain**. Type your domain, for example yourbusiness.com.
- 3 Resend shows a few DNS records (usually TXT and MX records). Add each one at your registrar, the same way as in Chapter 2.
- 4 Back in Resend, click **Verify**. It can take a few minutes, sometimes longer. Wait until the domain shows **Verified**.

GOOD TO KNOW

These records prove the emails really come from you. Without them, your emails land in spam or are rejected.

Step 2: Create an API key

- 1 In Resend, open **API Keys** and click **Create API Key**.
- 2 Give it a name such as "Platform" and **Sending access** permission.
- 3 Copy the key. Resend shows it only once.

Step 3: Connect it to your platform

Email (Resend) Not set up
Sends sign-up confirmations, password resets, admin invites and customer statements.

Resend API key

Create one at [resend.com](#) under API Keys. It is stored on the server and never shown again.

Send from Sender name
Must be on a domain you verified in Resend.

Website address

Used for links and your logo inside emails.

Save

One-time step so sign-up and password emails also use Resend
We turn this on for you when we set up your site. Once your key is saved above, sign-up and password emails go out from your own address.

Figure 6. The Email card in Integrations.

- 1 Open **System**, then **Integrations**, and find the **Email (Resend)** card.
- 2 Paste the key into **Resend API key**.
- 3 In **Send from**, type an address on your verified domain, for example no-reply@yourbusiness.com. In **Sender name**, type your site name.
- 4 In **Website address**, type your full site address, for example https://yourbusiness.com.
- 5 Click **Save**.

We connect the sign-up and password emails to Resend for you when we set up your site, so there is nothing else to do.

Make the platform yours

Your site starts with sample wording, plans and pop-ups. Change them before you invite customers. The **Admin Guide** explains every page in detail; this chapter covers the essentials.

Branding

Open **System**, then **Branding**. On the **Brand** tab, set your site name, upload your logos and favicon, choose colors, and add your social media links. On the **Business details** tab, add your legal business name and support contact details. Click **Save changes**.

Figure 7. Branding.

Investment plans

Open **Investment Plans**. Your site comes with four sample plans. For each plan, check the name, rate, minimum and maximum, length and minimum withdrawal. Change, pause or duplicate plans as you need. Then click **Mark as done** on the Setup Checklist.

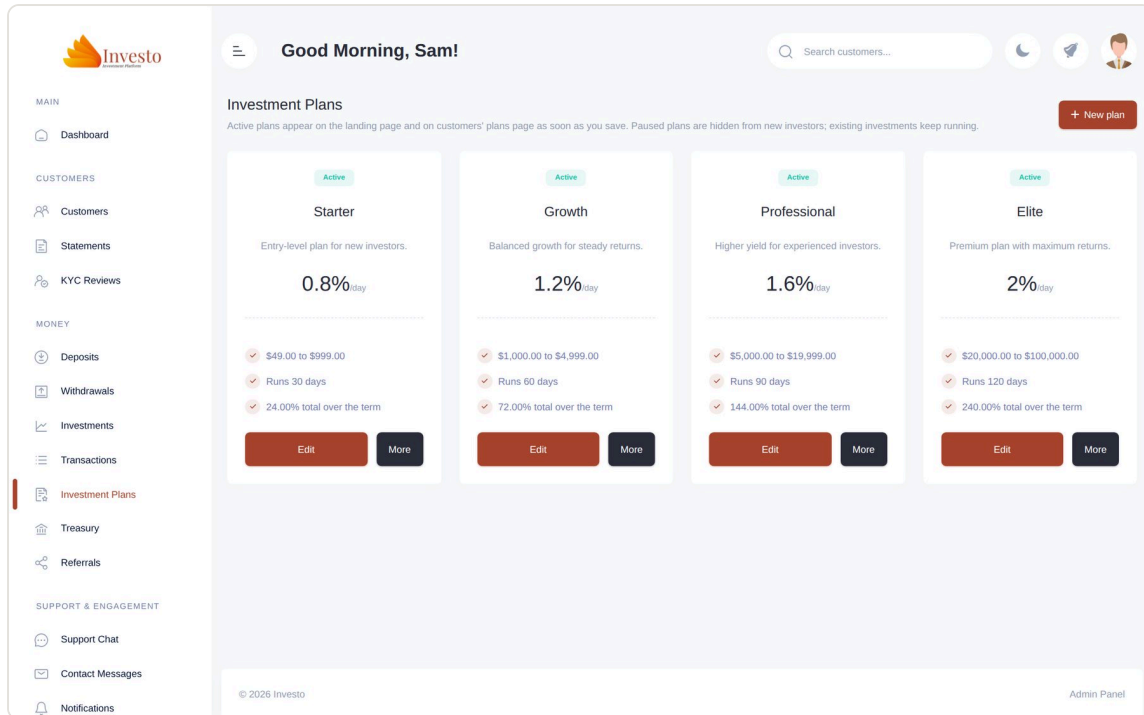

Figure 8. Investment Plans.

Website wording and pictures

Open **System**, then **Landing Page**. Change the headings, text, pictures, numbers and questions and answers to describe your business. Click **Save changes** and **View site** to check.

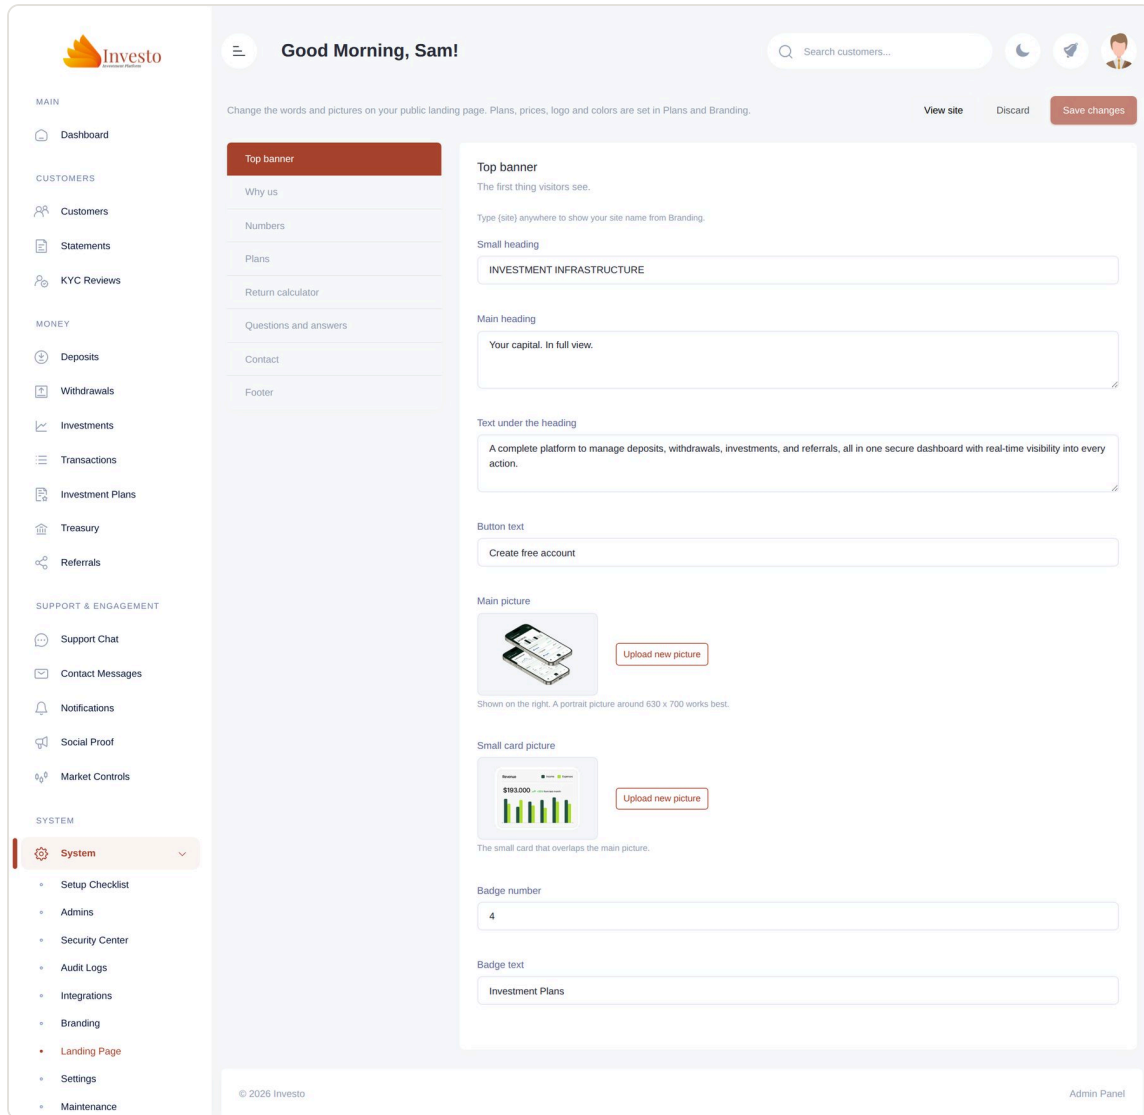

Figure 9. The Landing Page editor.

Activity pop-ups

Open **Social Proof**. The **Demo ticker** shows example activity to visitors, which helps a new platform feel busy. Read the lines, change any you do not like, and decide whether to keep it on. Real activity pop-ups show genuine events as customers join and invest. Then click **Mark as done** on the Setup Checklist.

Demo activity ticker

A rotating pop-up of example activity for marketing, shown on the website, the customer dashboard and here. These lines are not real customers. Leave name and location blank for a market line.

☒ Showing to visitors

Figure 10. The demo ticker switch.

Write your legal pages

Your site has four legal pages linked in the footer: **Terms of Service**, **Privacy Policy**, **Risk Disclosure** and **Refund Policy**. They start with sample text. You must replace it with text that fits your business and the laws of the countries you operate in.

GET LEGAL ADVICE

Investment platforms are regulated in many countries. Ask a lawyer to review your legal pages, and check whether you need a license where you and your customers are. You are responsible for your platform's legal compliance.

Editing a legal page

- 1 Open **System**, then **Landing Page**.
- 2 Under **Legal pages** on the left, click the page you want, for example Privacy Policy.
- 3 Edit the text in the box. Use these marks for formatting: start a line with **##** and a space for a heading, start a line with **-** and a space for a list item, put ****two stars**** around words for bold, and write **[link text]/(page)** for a link.
- 4 Type **{site}** anywhere to show your site name.
- 5 Click **Save changes**, then **View page** to check it. The page shows "Last updated" with today's date.

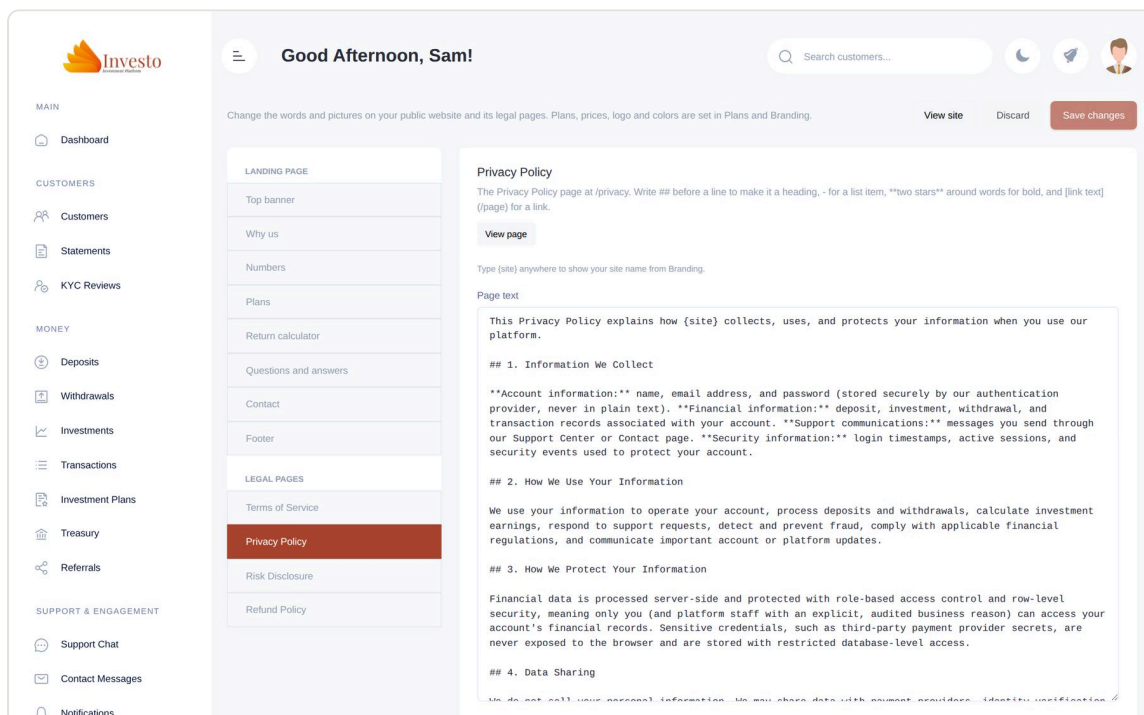

Figure 11. Editing the Privacy Policy.

The Setup Checklist turns this step green once all four pages are saved.

Final checks and launch

Before you tell anyone about your site, go through this list.

Check	Where
Every step on the Setup Checklist is green.	System, Setup Checklist
Test notifications are off. They show sample activity to signed-in customers.	Social Proof, Test and preview
Maintenance mode is off.	System, Maintenance
Your PayRam payout wallet holds enough USDT for withdrawals, plus TRX for fees.	Your PayRam dashboard
Your support email works and you check it daily.	Your email

Make a real test

The only way to be sure everything works is to use it like a customer, with a small amount of real money.

- 1 Open your site in a private browser window and create a customer account with a personal email.
- 2 Confirm the email you receive. This checks Chapter 5.
- 3 Deposit \$10 through PayRam and check it arrives in the customer balance by itself. This checks Chapter 4.
- 4 Request a withdrawal of the smallest amount allowed to your own wallet.
- 5 In the admin panel, open **Withdrawals**, open the request and click **Approve and send with PayRam**. Check the USDT arrives in your wallet.

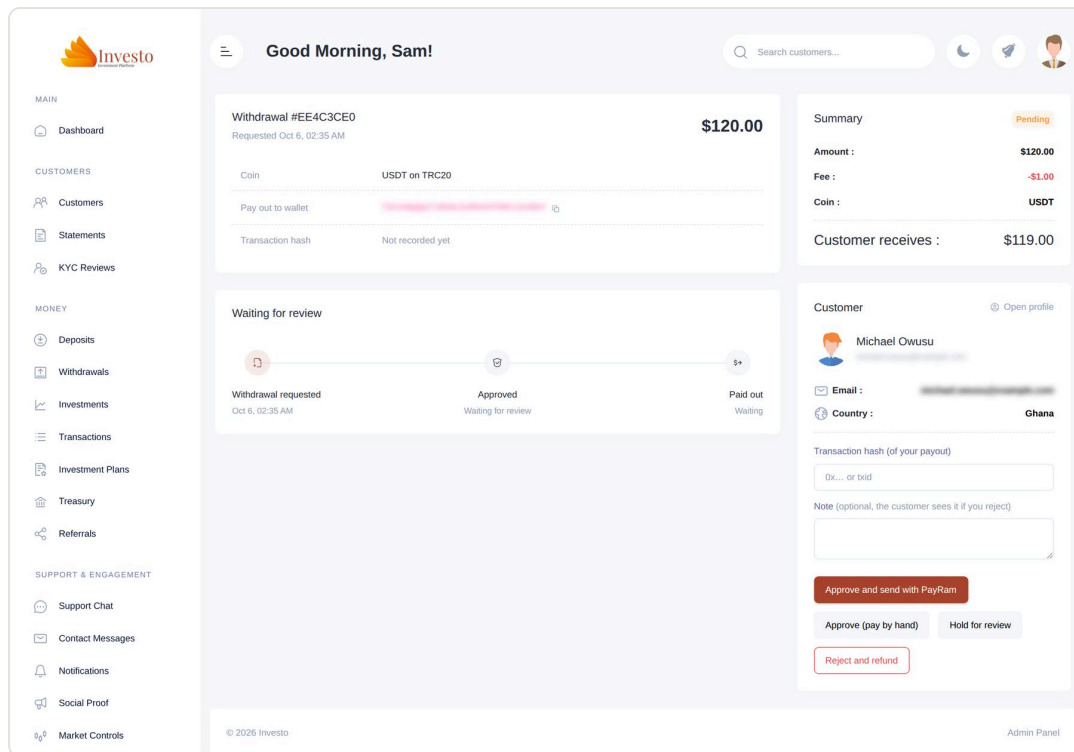

Figure 12. Paying the test withdrawal.

When both are completed, the Setup Checklist marks the test step as done. You are ready to launch.

Who handles what

We take care of	You take care of
Hosting the website, dashboard, admin panel and database	Your domain and its renewal
Security updates and new versions of the platform	Your PayRam server, wallets and seed phrases
Daily database backups	Your Resend account and email domain
Keeping the platform online	Your customers, their deposits and withdrawals
Setting up admin accounts for your team on request	Your legal pages, licenses and compliance
Fixing problems with the platform itself	Keeping your sign-in, phone and keys safe

Getting help

- For anything about the platform, contact us at the address in your welcome email.
- To add a team member to your admin panel, send us their email and what they should be able to do.
- We also build custom features, designs and integrations. Ask us for a quote.

Next steps

Read the **Admin Guide** to learn every page of your admin panel, and the **Customer Guide** to see your platform the way your customers do.
